

Keep it cool and power it up

Some helpful tips about the air-conditioning and power sockets...

USING THE AIR CONDITIONING (AC) IN YOUR APARTMENT / ROOM

- » You can select a temperature range from 19 to 24 degrees celsius on your AC unit.
- » You can select either cooling or heating and to ensure units are not left on while you are away, there is a motion sensor in the room that will turn it off once you leave the room.

ACTIVATING YOUR COOKTOP & MICROWAVE

To activate your cooktop, microwave and power points on the bench, you will need to press the white safety switch located next to the power point in the kitchen. NOTE: This will automatically switch off after 20 minutes.

POWER SUPPLY & ADAPTORS

If you are from overseas, you will need a power adapter to plug your appliances into the power sockets. Our main voltage is 240 volts so for some appliances (particularly from the US, Canada and Japan), you may also need to use a voltage converter. There is a USB socket next your bed for charging devices.

To conserve energy, the power in your room, including air conditioning, will turn off 30 minutes after you leave.
